Name	Description
response	A base64 string which proves that the user knows a password. <code>response = base64(evap-aes-256-cbc(password, key(activation_code), iv(cnonce)))</code> key: 256 bit, iv: 128 bit EX: assume password is "admin" <code>response = base64(evap-aes-256-cbc(admin, key("5a04ec902686fb05a6b7a338b6e07760"), iv("49153a7a0aed25a8")))</code>
nc	The nc-value is the hexadecimal count of the number of requests that the client has sent with the nonce value in this request.
cnonce	The cnonce-value is an opaque quoted string value provided by the client and used by both client and server to avoid chosen plaintext attacks
trackid	It is a 256-bit hex string converted from 128-bit integer number (UUID) used to authenticate user.
activation_code	It is a 256-bit hex string converted from 128-bit integer random number. It is the key of evap-aes-256-cbc during authentication.
uid	It is a 128-bit hex string to identify user.
